                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                This peptide represents a linear derivative of the protegrin family of peptide antibiotics. Protegrin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antibodies (or their antivirals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive mechanism, so can deliver active agents to cytoplasm and nucleus, including crossing the blood-brain barrier

The specification describes a pharmaceutical composition, which comprises at least one anticancer agent associated with at least one peptide that can transport it into cancer cells and which inhibits development of resistance to the anticancer agent. By using the peptide as a vector for delivery of the anticancer agent, mechanisms that cause cancer cells to avoided. Also, peptides are easily produced by chemical synthesis, are avoided. Also, peptides are easily produced by chemical synthesis, can be coupled easily to the agent, cross mammalian cell membranes rapidly by a passive mechanism (no receptors required), and are non-toxic and nonlytic. The compositions are used to treat cancer. The present sequence represents a peptide which may be linked to the anticancer agents of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytostatic; neurodegenerative; antidepressant; analgesic; antimicrobial; blood-brain barrier; diagnostic; central nervous system; protegrin; Antennapedia; tachyplesin; peptide antibiotic; Alzheimer's disease; cancer; Parkinson's disease; depression; pain; meningitis; dalargin.

The invention relates to the use of linear peptides, coupled to an active agent, to prepare a composition able the cross the blood-brain barrier for diagnosis or treatment of disorders localised in the central nervous system. The linear peptide preferably has the formula: (a) X1- X16; (b); EXXEXXXXBBEXXXXXBEXXXXBEXXXBEX, where: each of X1-X16 are amino acids (aa), of which 6-10 of them are hydrophobic and X6 must be TTp; each B is an aliphatic or aromatic aa. The linear peptide may be TTp; each B is an aliphatic or aromatic aa. The linear peptide may be C TTp; each B is a containing a side chain that includes a basic group; and each X is an aliphatic or aromatic aa. The linear peptide may be C TTp; each B is a containing D - and/or 1-form aa, or a fragment containing at least 5, preferably at least 7 consecutive as from (a)-(c). Peptides able to cross the BBB include protegrins, Antennapedia, categories based on their structure: (i) peptides with alpha-helices, e.g. protegrin, tachyplesins, defensins, dili) peptides with alpha-helices, categories based on their structure: (i) peptides with alpha-helices, con major structure but containing bends due to the presence of Protesidues, e.g. bactericins and PR39. The peptides of the invention fall contour structure but containing bends due to the presence of Protegrins; and (c)-peptides are based on the Antennapedia family peptides; (b)-peptides are based on the Antennapedia family peptides, (b)-peptides are based on the peptide may also be linked to a benzylpenicillin molecule by a succinate containing the peptide or peptide and the active containing the peptide and peptides and the active containing the peptide and peptides and the active containing the peptide and peptides are pasted on the Antennapedia family peptides. The peptides and the active conjugated to a doxorubicin molecule by a succinate by a succinate containing the peptide and peptides and the active conjugated to a doxorubicin molecule by a succinate propertic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              also for studying drug behaviour in BBB models

The present invention relates to a composition (A), comprising at least one antibody (Ab), or its fragment, linked to at least one linear peptide (P) that is derived from protegrins or techyplesing, or includes a transduction domain. (A) is useful for diagnosis and treatment of diseases of the central nervous system, e.g. neurodegenerative diseases such as Alzheimer's and Parkinson's diseases, brain cancer or HIV infection of the brain. The present peptide was used to illustrate the invention
                                                                                                                                                           The invention relates to a conjugate of an antigen, which is coupled to a linear derivative of a beta-stranded antibiotic peptide. The conjugate is useful for enhancing the immune response of a mammal to an antigen. The conjugate is particularly useful in vaccination or prophylaxis. The present sequence represents a linear derivative of a beta-stranded antibiotic peptide
                                             New conjugates of antigens, which are coupled to a linear derivative of a beta-stranded antibiotic peptide, useful for enhancing the immune response of a mammal to an antigen, particularly useful in vaccination or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New composition, useful for treating central nervous system diseases, comprises an antibody linked to a linear peptide and is able to cross the

The present sequence is one such peptide. The peptides are useful as carriers for delivering attached active agents to cells, specifically to a target site in cytoplasm or the nucleus, for therapeutic or diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antibiotic; antigen; immunostimulant; vaccine; immune response.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The specification describes a lipid-nucleic acid complex, comprising a compacted nucleic acid, a polyation, a targeting factor and a lipid, but not a protamine. The targeting factor increases cellular bloavailability of the nucleic acid without interaction with a specific outer cell surface membrane receptor. The mean diameter of the complex is greater than 100 nm and less than 400 nm. The lipid-nucleic acid complex is useful for delivering a nucleic acid to a cell in vivo, e.g. for gene therapy. It reduces levels of inflammatory cytokines such as tumour necrosis factor-alpha. The complex is useful for manufacturing a medicament for treating or diagnosing a variety of diseases, conditions or syndromes such as cancer, bacterial, viral or parasitic infections, immune deficiencies, gene defects, and gene deficiencies (e.g. inherited genetic diseases). The present sequence represents a membrane translocating peptide, which is used as the targeting factor in lipid-nucleic acid complexes of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of preparing artificial transcription factor (ATF) capable of modulating expression of a gene by interaction with a target site associated with the gene. The method comprises preparing a combinatorial library of ATFs, each of the ATFs comprising a DNA-binding domain and a transcriptional regulatory domain. The invention particularly to the identification of a context-independent recognition code to zinc finger domains. The methods are useful for treating disease in a plant, for crop protection and for producing genetically transformed disease-resistant plants. The present sequence is symbl peptide used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Preparing an artificial transcription factor (ATF) capable of modulating expression of a gene by interaction with a target site associated with the gene, for treating plant disease, comprises preparing a combinatorial library of ATFs.

Nucleic acid target-specific chimeric proteins comprising a nuclear-
envelope and/or nuclear lamina binding domain and a DNA binding domain
used in methods to repress or down-regulate expression of selected genes.
Zinc finger protein; ZFP; artificial zinc finger protein; AFP; nuclear envelope; nuclear lamina; heterochromatin; GCL protein; gene expression; cytokine; interleukin; oncogene; anglogenesis factor; drug resistance protein; growth factor; tumour suppressor; DNA binding.
                                                                                                                                                                                                                                                       Disclosure; SEQ ID NO 15; 60pp; English.

```
The invention relates to a nucleic acid target-specific chimeric protein comprising one or more first domains capable of specifically binding a nucleotide sequence associated with a target gene, and one or more second domains capable to associating with the nuclear periphery, where at least cone of the first domains is heterologous with respect to at least one of the second domains. The one or more first domains comprise at least three cone of the second domains. The one arother. The one or more second domains (arcetly joined to one another. The one or more second domains directly or indirectly associate with or bind to the nuclear envelope, the nuclear lamina, heterochromatin or any combinations of these. One of the second domains is a GCL protein or a binding moisty of a GCL protein. The chimeric proteins of the invention and the nucleic acids encoding them can used to repress, down regulate or decrease gene expression of a factor or a tumour suppressor. The chimeric proteins an anglogenesis can be used to repress, on anti-anglogenesis factor, a drug resistance protein, a growth factor or a tumour suppressor. The chimeric proteins can be used to confibility the expression of a disease associated gene. The invention provides a new method of transcriptional repression of genes. Previously cused transcription factors have limited utility or are limited to a set of closely related target sequences in a large complex sponee. An example from the invention demonstrates the repression of the human variant contracts and many encoder and proteins with predetermined sequence. An example from the invention demonstrates the repression of the human variant contracts and many encoder and proteins with predetermined sequence. An example from the invention demonstrates the repression of the human variant and the protein the human contracts the repression of the human contracts and many encoders and proteins with predetermined because the protein contracts and many encoders and proteins with predetermined because the human var
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     capable of carrying substances across the blood brain barrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 18 AA;

such New cyclosporin derivatives, containing bonded peptide vector for crossing blood-brain barrier, used for treating cerebral disorders as neurodegenerative diseases, cerebral trauma or cerebrovascular accidents.

Disclosure; SEQ ID NO 6; 77pp; French.

The invention relates novel cyclosporin compounds (1) comprise at least core cyclosporin molecule (II) and at least one peptide vector (III) capable of transporting (1) across the blood-brain barrier. (1) are used come cyclosporin molecule (II) and at least one peptide vector (III) are capable of transporting (1) across the blood-brain barrier. (1) are used core the treatment or prevention of: (1) acute neurological disorders, exposure to radiation, chemotherapy, epilepsy, schizophrenia, cerebral or spinal cord leasness exposure to radiation, chemotherapy, epilepsy, schizophrenia, cerebral or spinal cord diseases as leated from Alzahimer's disease, barkinson's disease.

C diseases selected from Alzahimer's disease, barkinson's disease.

New fusion protein comprising a cold shock domain, and a membrane translocation sequence, useful for delivering DNAs and RNAs to in vivo cells for gene delivery

Claim 9; SEQ ID NO 17; 24pp; English.

The invention describes a fusion protein for delivery of a desired molecule into cells or nuclei, comprishing a cold shock domain, its homologue and functional derivative, and a membrane translocation sequence or its functional equivalent peptides and/or derivatives. The fusion protein comprises a cold shock domain that is selected from CspB, CspB, CspC, CspD, rpl Sl binding domain, eukaryotic, Y-box proteins, DNA binding protein B (DBPB), DBPA, EPE-1, mRNP3, mRNP4, FRG YI and nuclease-

derivative element binding protein 1 (NSEP 1). The functional equivalent derivative of cold shock protein is modified by inserting into the cold shock domain with a DNA condensation domain or a DNA binding domain. The DNA condensation or binding domain is selected from DNA condensation domain (SPRR) 3-4 and the positive charge nuclear localisation sequences (NLS+). The membrane transduction sequence is protein transduction domain (PTD) or membrane tusion sequence. The fusion protein further comprises a protein purification tagged sequence selected from HA, GST, and His6 tag. The fusion protein is useful for delivering DNAs and RNAs to in vivo cells for gene delivery, or for delivering nucleic acids to an embryo or to a living animal for the production of transgenic animal. This is the amino acid sequence of protegrin/porcine leukocyte derived synBI membrane fusion sequence.

New fusion protein comprising a cold shock domain, and a membrane translocation sequence, useful for delivering DNAs and RNAs to in vivo cells for gene delivery. 

Claim 9; SEQ ID NO 15; 53pp; Japanese.

The invention relates to a novel fusion protein for delivery of a desired molecule into cells or nuclei comprising a cold shock domain, its homologue and functional derivative and a membrane translocation sequence or its functionally equivalent peptides and/or derivatives. The fusion protein of the invention may be useful for delivering DNAs and RNAs to in vivo cells for gene therapy or for delivering mucleic acids to an embryo or to a living animal for the production of transgenic animals. The current sequence is that of a membrane fusion sequence peptide of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is that of SynB1, a membrane-permeable peptide of protegrins. The peptide has been examined previously as a means for improving drug delivery through the blood-brain barrier. The present invention provides a conjugate blood-gradable aliphatic polyesterbased polymer and the membrane-permeable Tat49-57 peptide ADG73829 from HIV-1, or a peptide including Tat49-57. The Tat49-57 peptide (A) and the biodegradable aliphatic polyester-based polymer (B) are constituted as A-B type or A-B-A type. The conjugate is used to manufacture nanoparticles of average diameter not more than 1,000 nm. These nanoparticles can be used as a drug delivery system with an improved bioavailability in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Conjugate of biodegradable aliphatic polyester-based polymer with Tat (49-57) peptide or peptide chain containing the Tat (49-57) peptide, useful for manufacturing nanoparticle with enhanced intracellular permeability.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel conjugate of a biodegradable aliphatic polysester-based polymer with a Tat (49-57) peptide or a peptide chain containing the Tat (49-57) peptide. The invention further relates to a nanoparticle manufactured using the conjugate. The novel conjugate is useful for manufacturing a nanoparticle with an average diameter of not more than 1000 nm. The conjugate enhances the intracellular permeability of the manufactured nanoparticle. This sequence represents a membrane-permeable doxorubicin anticancer agent peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cell penetrating peptide (CPP) identification method-related peptide 106.
conjugate; biodegradable aliphatic polyester-based polymer; Tat (49-57); nanoparticle; intracellular permeability; doxorubicin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention relates to conjugates of an antigen coupled to a linear derivative of a beta-stranded antibiotic peptide. The invention is useful for enhancing the immune response of a mammal to an antigen. The invention is also useful in the production of vaccines. The present sequence is a beta-stranded protegrin (antibiotic) peptide linear
                                                                                                                                                                                                                                                                                                                                                                                New conjugates of an antigen coupled to a linear derivative of a beta-
stranded antibiotic peptide, useful for enhancing the immune response of
a mammal to an antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   disease treatment; active substance transport; bioavailability; SymBl;

                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to a novel method of identifying, designing, detecting, and/or verifying novel cell-penetrating peptide (CPP) based on assessment of bulk property value Z-B of sequences of CPP comprising 5 or more individual average interval values Z-B1, Z-B2, Z-B4 and Z-B5, CC more individual average interval values Z-B1, Z-B2, Z-B4 and Z-B5, where Z-B1, Z-B2, Z-B4 and Z-B5 are average values of the cepective descriptor values for the residues in the amino acid sequence. The invention may be useful for the development of compounds with an antidiabetic, neuroprotective, nootropic, antiparkinsonian, cardiant, cytostatic, tranquiliser, immunosuppressive, antidepressant, antidial ammatory, analgesic, neuroleptic, ophthalmological or antiulcer activity as a stimulator of cell-contracting peptide or protein and/or a cell-penetrating fragment of a peptide or protein. In addition, the invention may be useful for checking cellular penetrating peptide or protein and/or a cell-penetrating and functional protein-mimicking peptide and for de novo design and production of an artificial cell-penetrating and functional protein-mimicking peptide and for de novo design and production of an artificial cell-penetrating and functional protein-mimicking peptide cusful for treating infectious diseases, diabetes type I, diabetes type CC cardiovascular disease or disorders resulting from perturbed signal cransdovascular disease. Perturbed design of the present invention of a broad variety of CPPs and designal cransdovascular designal cransdovascular desi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                  Predicting, designing, detecting, and/or verifying novel cell-penetrating peptide based on assessment of bulk property value of sequences of cell-penetrating peptide.

```
substance and at least one vector, connected by a linker that includes a chydroxyproline residue. The linker is of a formula given in the pyecification. The vector modifies the physicochemical or pharmacokinetic properties of the active substance. The active substance is a protein, colly) peptide, antibody (or fragment), nucleic acid, oligonucleotide, cribozyme, or a chemical for treatment or prevention of human or animal disease, e.g. an antitumour or antiviral agent. Alternatively, it is a radioactive or coloured material, or some other substance suitable as indicator of metabolism or disease. Compounds of the invention are used for treatment, prevention and diagnosis of disease in human or veterinary medicine. They facilitate transport of the active substance across che biological barriers and its penetration into cells, and they also modify the bioavailability or solubility of active substances. The present sequence represents a peptide designated SynBl. SynBl was joined to incention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inhibiting the binding of the cytoplasmic domain of MUC1 to a PDZ domain, comprises contacting the PDZ domain with an agent that competes with the binding of the C-terminal region of the cytoplasmic domain of MUC1 with the PDZ domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MUC1-PDZ domain binding inhibitor transmembrane transporter peptide #20.
                              specification describes a compound comprising at least one active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cytoplasmic domain; MUC1; PDZ domain; transmembrane transporter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Jecminek AA, Kharbanda S,

The invention relates to a method of inhibiting the binding of the cytoplasmic domain of MUC1 to a PDZ domain, by contacting the PDZ domain with an effective amount of an agent that competes with the binding of the C-terminal region of the cytoplasmic domain of MUC1 with the PDZ domain is ZO-1 d2, SIPA in LM MYSTIQUB, AIPC, KIAA0751, MAST2, PRIL-16 d1, GRIP2 d5, SITAC 18, NSP or KIAA1526 d1. The agent that competes with binding of the C-terminal region of cytoplasmic domain of MUC1 with the PDZ domain is a peptide of the formula (I): XI-aa2-aa1-aa0, where aa0 is a hydrophobic aliphatic amino acid residue, aromatic amino acid residue, pala amino acid residue, and xi a sequence of 0-50 amino acid residue; and XI is a sequence of 0-50 amino acid residues. Preferably aa2-aa1-aa0 is selected from SEQ ID NO: 1-40 (ADU15617-ADU15656) and XI may be selected from SEQ ID NO: 4-94 (ADU15677-ADU15656) and XI may be selected from SEQ ID NO: 4-94 (ADU156577-CYCO). The method is useful for inhibiting the binding of the cytoplasmic domain of MUC1 to a PDZ domain. The method is contain a transmembrane transporter peptide. The cytoplasmic domain a desired from SEQ ID NO: 97-127 (ADU15713-CYCO ADU15713). This peptide is derived from a pegelin protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a pharmaceutical nucleic acid carrier composition (Cl), comprising a carrier substance covalently or noncovalently coupled to a nucleic acid intercalator; where the nucleic acid intercalator is coupled to a nucleic acid. Cl can be synthesized by coupling a carrier substance to intercalator to produce a carrier substance to intercalator to produce a carrier substance having intercalator coupled to it, and combining the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pharmaceutical nucleic acid carrier composition useful in therapeutic applications for targeting delivery of nucleic acids to their site of action, having carrier substance covalently/non-covalently coupled to

```
intercalation of the coupled intercalator and the nucleic acid. (C1)

further comprising a targeting molecule or transduction vector coupled to the carrier substance. The covalent coupling of the carrier substance to intercalator is a biocleavable linkage chosen from a hydrazone linkage, and intercalator is a biocleavable linkage chosen from a hydrazone linkage, classified linkage is prosphoramide linkage chosen from a hydrazone linkage, ester linkage, phosphoramide linkage, biocleavable polypeptide, aromatic azo linkage and aldehyde bond. (C1) further comprising a chloroquine cost linkage and aldehyde bond. (C1) further comprising a chloroquine consen from avidins, streppavidins, lipsomes, micelles and dendrimers. The method further involves coupling targeting molecule or transduction cervier. (C1) is useful for delivering molecule acids for therapeutic or other medicinal uses. (C1) is useful for targeting the delivery of nucleic acids to their site of action. (C1) delivers nucleic acids into eite of action and improves their effectiveness. The present sequence represents a transduction peptide that can be used as the transduction correct in the method of the invention.

New cyclosporin derivatives, containing bonded peptide vector for crossing blood-brain barrier, used for treating cerebral disorders such as neurodegenerative diseases, cerebral trauma or cerebrovascular accidents

Disclosure; SEQ ID NO 5; 77pp; French.

The invention relates novel cyclosporin compounds (1) comparise at least one cyclosporin molecule (II) and at least one peptide vector (III) come cyclosporin molecule (II) and at least one peptide vector (III) cate used for the treatment or prevention of: (i) acute neurological disorders, capable of transporting (I) across the blood-brain barrier. (I) are used for the treatment or prevention of: (i) acute neurological disorders, cadation, chemotherapy, epilepsy, echizophrenia, cerebral or spinal cerebral schemia, ruptured ansurerysms, subarachnoid hemorrhage, ascular spasms or hemorrhagic vacquiar accidents (II) neurodegenerative diseases or hemorrhagic vacquiar accidents (II) neurodegenerative diseases partinon, bulbar paralysis, schizophrenia, Tourette syndrome, diffuse cerebrocortical atrophy, leaw body dementia, Tourette syndrome, diffuse cerebrocortical atrophy, leaw body dementia, ortico- striato-spinal degeneration, Sty Drager syndrome, Richardeon-Steele crebrocortical atrophy, leaw body dementia, ortico- striato-spinal degeneration, fick disease, multilaystem dementia, ortico- striato-spinal degeneration, Sty Drager syndrome, anyotrophic lateral solerosis-down dementia complex, post-polic syndrome, olivo-cereballar atrophy, Friedrach Complex, post-polic syndrome, NISO metalogenty, disease, Tay Sachs ganging, (IV) terrorizal complex, post-polic syndrome, Traumatic Chronic encephalopathy of the dementia, wilson disease, what NISO myslopathy, NISO gases passes and saction desease, and accentification decembers. To complex, post-polic syndrome, traumatic chronic encephalopathy or tropical parapareals, (V) visual and retinal disease passes and sactinal degeneration, macular degeneration, dispetic degeneration, dispetic, detected with certain diseases, such as creating degeneration, dispetic degeneration, macular degeneration, dispetic degeneration, macular degeneration, dispetic degeneration, macular pressure, (VI) viral and baccerial diseases senting or creations or draves disease (VI) will minimal degenera rheumatoid arthritis, eczema, psoriasis or alopecia; or (xi)) chemotherapy-resistant tumors. This sequence is an example of the peptide comprise at least invention relates novel cyclosporin compounds (I)

Amino acid sequence of a peptide designated Gly-SynBl.

disease treatment; active substance transport; bloavailability; Gly-SynBl; cyclosporin A. 0×2×6×6×6×

27-AUG-2004.

Rees AR,

```
This peptide represents a linear derivative of the protegrin family of peptide antibiotics. Protegrin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridges. The nevel derivatives are used to deliver active agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligomucleotides, ribozymes, antitumour agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive mechanism, so can deliver active agents to cytoplasm and nucleus, including crossing the blood-brain barrier
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The specification describes a pharmaceutical composition, which comprises at least one anticancer agent associated with at least one peptide that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Anticancer agent; cancer cell; resistance; P-glycoprotein pump; cancer.
                                                                                                                                                                                                                              Derivatives of antibiotic peptides lacking disulfide bridges - used as carriers to deliver active agents into cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New composition useful for cancer treatment and prevention, contains anticancer agent and peptide vector that transports agent into cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score 81; DB 2; Length 18;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The specification describes a compound comprising at least one active substance and at least one vector, connected by a linker that includes a hydroxyproxine residue. The linker is of a formula given in the specification. The vector modifies the physicochemical or pharmacokinetic properties of the active substance. The active substance is a protein, (poly) peptide, antibody (or fragment), nucleic acid, oligonucleotide, ribozyme, or a chemical for treatment or prevention of human or animal disease, e.g. an antitumour or antiviral agent. Alternatively, it is a radioactive or coloured material, or some other substance sultable as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 indicator of metabolism or disease. Compounds of the invention are used for treatment, prevention and diagnosis of disease in human or veterinary medicine. They facilitate transport of the active substance across biological barriers and its penetration into cells, and they also modify the bloavailability or solubility of active substances. The present sequence represents a peptide designated Gly-SynB1. Gly-SynB1 was joined to cyclosporin A via a linker to produce exemplary compounds of the

can transport it into cancer cells and which inhibits development of resistance to the anticancer agent. By using the peptide as a vector for delivery of the anticancer agent, mechanisms that cause cancer cells to become resistant to the agent, particularly the P-glycoprotein pump, are avoided. Also, peptides are easily produced by chemical synthesis, can be coupled easily to the agent, cross mammalian cell membranes rapidly by a passive mechanism (no receptors required), and are non-toxic and non-lytic. The compositions are used to treat cancer. The present sequence represents a peptide which may be linked to the anticancer agents of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New conjugates of antigens, which are coupled to a linear derivative of a beta-stranded antibiotic peptide, useful for enhancing the immune response of a mammal to an antigen, particularly useful in vaccination or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a conjugate of an antigen, which is coupled to a linear derivative of a beta-stranded antibiotic peptide. The conjugate is useful for enhancing the immune response of a mammal to an antigen. The conjugate is particularly useful in vaccination or prophylaxis. The present sequence represents a linear derivative of a beta-stranded

coupled to a linear derivative of a betauseful for enhancing the immune response of
                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to conjugates of an antigen coupled to a linear derivative of a beta-stranded antiblotic peptide. The invention i useful for enhancing the immune responses of a mammal to an antigen. The invention is also useful in the production of vaccines. The present sequence is a beta-stranded protegrin (antibiotic) peptide linear
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gonadotrophin releasing hormone analogue; neurotoxin; prostate cancer; endocrine disorder; gonadotrophin related iliness; endometrial cancer; pancreatic cancer; breast cancer; endometriosis; precocious puberty; GNRH-A; therapy; penetratin

New amphipathic derivatives of antibiotic peptides, are useful for delivering therapeutic and diagnostic agents to cells, provides efficient transport across membranes.
                                                                                     The present invention related to novel amphipathic antibiotic peptides. The present sequence is one such peptide. The peptides are useful as carriers for delivering attached active agents to cells, specifically to a target site in cytoplasm or the nucleus, for therapeutic or diagnostic

                                                                                                                                                                                                                                                             The invention relates to an agent comprising a neurotoxin preferably botulinum toxin for treating endocrine disorders for e.g. gonadotrophin related illness. The agent is useful for treating gonadotrophin related illness e.g. prostate cancer, endometrial cancer, pancreatic cancer, breast cancer, endometriosis or precocious puberty. It is also useful for decreasing gonadotrophin secretion in a mammal. The present sequence is membrane translocation peptide, penetratin. This peptide is used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to new compounds comprising at least one therapeutic agent for the treatment of lung cancer or pulmonary diseases and at least one carrier peptide for increasing the bioavailability of the compounds in the lungs, being one of two specific peptides designated SynB4 and SynB6. The compounds are used for treating lung cancer or pulmonary diseases. The pulmonary diseases include bronchitis, emphysema, pneumonia (e.g. pneumonia caused by opportunistic Pseudomonas bacteria), cystic fibrosis and tuberculosis (Mycobacterium tuberculosis infection). The peptide transports the active agent selectively to the lungs, thus increasing the bioavailability of the compound and promoting incorporation of the compound into the lungs and reducing side-effect problems. The present sequence represents SynB6 peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New compounds useful for treating e.g. lung cancer or pulmonary diseases, comprises active agent e.g. doxorubicin, bonded to peptide carrier to increase bioavailability in lungs.
                                                                                                                                                                                                                                                                                                    lung cancer; pulmonary disease; SynB4; SynB6; Cytostatic; Antibiotic; Antibacterial; Tuberculostatic; Antiinflammatory.

                                                                                                                                                                                                                                     The present sequence is a specifically claimed example of a peptide, recombinantly produced, corresponding to the generic formula: Al-A2-A3-A4-C45-A7-C49-A1-C45-A12-A11-A12-C48-A14-C48-A16-(A17-A18) Where A1 = a A5-C49-A1-C49-A14-C49-A14-C49-A14-C49-A14-C49-A14-A18) Where A1 = a basic and A3 = a small amino acid; A4 = a basic or small amino acid; A5, A7 and A14 = a hydrophobic amino acid; A9, A12 and A16 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar or small amino acid; A17 may be absent or a basic, neutral/polar, hydrophobic or small amino acid; and A18 may be absent or a basic, neutral/polar, hydrophobic or small amino acid; and CC cterminal amidated or efferfited forms, all of which may contain a cid. A18 may be absent or a basic, neutral/polar, hydrophobic or small amino acid; and CC cterminal amidated or efferfited forms, all of which may contain a cid. A18 may be absent or a cysteine bridge. This peptide is in snake form where all the cystine residues are replaced by a hydrophobic, small or carefited protegrins and are useful as anti-bacterial, anti-viral and anti-timgal agents in plants and anti-bacterial, anti-corresponded to microbial or viral infection in plants by preventing the creatment of a virus or microbe and inactivate the endotoxin of gram-corresponded to microbial or viral infection in plants by microorganisms eggine treatment of sexually transmitted disease caused by microorganisms eggineservatives for food: The protegrins are more effective under conditions (egg. in the presence of serum) than certain continue and are non-coxic to the cells of higher organisms. The invention describes a purified and isolated or recombinantly produced peptide compound selected from any of the 43 fully defined sequences of 16-18 amino acids, given in the specification, or itse N-terminal acylated or classified forms in linear or cysteine-bridged form. Also described are: a pharmaceutical composition for antimicrobial cor antiviral use, comprising any of the peptides cited above in admixture with at least one excipient; and a composition for application to plants or plant environments for conferring resistance to microbial or viral infections in plants comprising any of the peptides cited above in a diffection in plants comprising any of the peptides are useful as preservatives and in preventing, treating or ameliorating viral or microbial infections in animals and plants, and in inactivating contact endotoxins. They are particularly useful in eye care, such as in contact endotoxins. They are particularly useful in eye care, such as in contact reating sexually transmitted diseases (STDS). This is the amino acid sequence of an antimicrobial protegrin peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antimicrobial peptide; protegrin; microbe growth inhibitor; Pseudomonas; microbial infection; Staphylococcus aureus; Helicobacter pylori; therapy; antibiotic-resistant bacterium; disinfectant composition; preservative; haemolytic activity; systemic antibiotic.

                                                                                                                                                                                                                                                                                                                  This sequence represents an example of an antimicrobial peptide (I) of the invention, and comprises 10-30 amino acid residues based on a naturally-occurring protegrin peptide. The antimicrobial peptide is useful in environmental composition for application to plants or plant environments, for inhibiting the growth of microbes. The peptide is useful for treating or preventing microbial infections, e.g. caused by Staphylococcus aureus, Pseudomonas, Helicobacter pylori or an antibiotic resistant bacterium, or related diseases. The peptide can be used to inactivate the endotoxin of Gran-negative bacteria. The peptides can be used in disinfectant compositions, and as preservatives for materials such as foodstuffs, cosmetics, medicaments or other materials containing nutrients for organisms. The peptides exhibit decreased haemolytic cativity against human red blood cells as compared with native PG-1 and melittin. They have improved serum compatibility and therefore improved use as systemic antibiotics. At the same time the peptides provide broad spectrum activity with a low frequency of resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antimicrobial peptide, protegrin, microbe growth inhibitor, Pseudomonas, microbial infection, Staphylococcus aureus, Helicobacter pylori, therapy, antibiotic-resistant bacterium, disinfectant composition, preservative,

This sequence represents an example of an antimicrobial peptide (I) of the invention, and comprises 10-30 amino acid residues based on a naturally-occurring protegrin peptide. The antimicrobial peptide is useful in environmental composition for application to plants or plant cenvironments, for inhibiting the growth of microbes. The peptide is useful for treating or preventing microbial infections, e.g. caused by Staphylococcus aureus, Pseudomonas, Helicobacter pylori or an antiblotic resistant bacterium, or related diseases. The peptide can be used to inactivate the endotoxin of Gram-negative bacteria. The peptides can be used in disinfectant compositions, and as preservatives for materials cuch as foodstuffs, cosmetics, medicaments or other materials containing nutrients for organisms. The peptides exhibit decreased haemolytic activity against human red blood cells as compared with native PG-1 and melittin. They have improved serum compatibility and therefore improved use as systemic antibiotics. At the same time the peptides provide broad spectrum activity with a low frequency of resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                 broad spectrum of activity against microbial targets, including gran-
positive and gram-negative bacteria, yeast, fungi, protozoa and certain
strains of viruses and retroviruses, e.g. HIV. It can be used to preserve
or disinfect a variety of materials, including medican equipment,
foodstuffs, commetics, contact lens solutions, medicaments or other
nutrient containing materials. It can also be used for the prophylaxis or
treatment of microbial infections or diseases in plants and animals, e.g.
conjunctivitis, keratitis, corneal ulcers, stomach ulcers associated with
Helicobacter pylori, sexually transmitted diseases, gram-negative sepsis,
endocarditis, pneumonia and other respiratory infections, urinary tract
infections systemic candidiasis and oral mucositis. It is biostatic or
biocidal against clinically relevant pathogens exhibiting multi-drug
resistance, e.g. vancomycin resistant Enterococcus faecium or faecalis,
penicillin resistant Streptococcus pneumoniae and methicillin resistant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antibacterial; antiviral; antifungal; antibiotic; endotoxin;

The invention describes a purified and isolated or recombinantly produced peptide compound selected from any of the 43 fully defined sequences of 16-18 amino acids, given in the specification, or its N-terminal acylated or cid-16-18 amino acids, given in the specification, or its N-terminal acylated or esterrified forms in linear or cysteine-bridged form. Also described are: a pharmaceutical composition for antimicrobial or antiviral use, comprising any of the peptides cited above in admixture with at least one excipient; and a composition for application to plants or plant environments for conferring resistance to microbial or viral infections in plants comprising any of the peptides cited above in admixture with at least one diluent. The peptides are useful as preservatives and in preventing, treating or ameliorating viral or microbial infections in animals and plants, and in inactivating contact microbial infections, and in topical and pharmaceutical compositions for treating sexually transmitted diseases (STDB). This is the amino acid sequence of an antimicrobial protegrin peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                virucide; antimicrobial; peptide therapy; recombinant peptide compound; antiviral; viral infection; microbial infection; endotoxin inactivation; eye care; contact lens solution; topical composition; pharmaceutical composition; exually transmitted disease; STD; protegrin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New peptide in its N-terminal acylated or C-terminal amidated or esterified form in linear or cysteine-bridged form, useful for treating sexually transmitted diseases and as preservatives.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gu CL, Chen J, Steinberg DA,

The invention describes a purified and isolated or recombinantly produced peptide compound selected from any of the 43 fully defined sequences of 16-18 amino acids, given in the specification, or its N-terminal acylated or C-terminal amidated or esterified forms in linear or cysteine-bridged or C-terminal amidated or esterified forms in linear or cysteine-bridged form. Also described are: a pharmaceutical composition for antimicrobial or antiviral use, comprising any of the peptides cited above in admixture with at least one excipient; and a composition for application to plants or plant environments for conferring resistance to microbial or viral infections in plants comprising any of the peptides cited above in admixture with at least one diluent. The peptides cited above in conferring treating or ameliorating viral or microbial infections in animals and plants, and in inactivating or endotoxins. They are particularly useful in eye care, such as in contact lens solutions, and in topical and pharmaceutical compositions for treating sexually transmitted diseases (STDS). This is the amino acid sequence of an antimicrobial protegrin peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New peptide in its N-terminal acylated or C-terminal amidated or esterified form in linear or cysteine-bridged form, useful for treating sexually transmitted diseases and as preservatives.
                                                                                                                                                                                                                                                                                                                                                                                                   Chen J, Steinberg DA, Lehrer RI, Harwig SSL;

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Description

Fublication No. US20030220474A1

GENERAL INFORMATION:
APPLICANT: PACIFIC CORPORATION
TITLE OF INVENTION: Conjugate of biodegradable aliphatic polyester with Tat49-57
TITLE OF INVENTION: peptide or peptide chain containing Tat49-57 peptide, and
TITLE OF INVENTION: nanoparticle manufactured using the same
TITLE OF INVENTION: UNMER: US/10/185,593
CURRENT APPLICATION NUMBER: US/10/185,593
CURRENT FILING DATE: 2002-06-28
NUMBER OF SEQ ID NOS: 6
SOFTWARE: KopatentIn 1.71
SEQ ID NO 3
INSURTATION NUMBER: MARCHARD NUMBER: MARCHARD NUMBER: MARCHARD NO 3
INSURTATION NUMBER: MARCHARD NUMBER: M
